

safety. compliance. reliability.

Your fuel storage system is an investment that can seriously impact both public safety and the environment.

ConVault surpasses UL 2085 industry standards and leads the way in setting new benchmarks for safety and security to meet today's challenges for protecting the environment and the public.

ConVault UL 752

The Safest Tank You Can Buy

ConVault is the only Aboveground Storage Tank to carry the UL 752 Security Listing (Levels 5, 6 and 8) for ballistic resistance.

The ConVault fuel storage system goes beyond the UL 2085. It has also passed independent ballistics tests for armor piercing munitions specified by a number of organizations where protection and safety are a vital concern, including –

- Underwriter's Laboratory Security Listing UL 752 (Level 9)
- National Institute of Justice (NIJ) Level 4
- State Dept. (SD-STD-.02.01) Revision G
- ASTM F-1233 and UL Level 9

The ConVault Double Wall Containment Tank features –

- A six inch reinforced concrete vault and HDPE liner that protects both the primary and secondary containment steel tanks from corrosion, explosions, and ballistics.
- A closed secondary containment space that is a true void (no filling insulating material), allowing for reliable pressure testing and immediate migration of any leak to the monitoring point.
